Food for Thought: Can Diet Play a Role in Lung Cancer?

John Sacco, MD
Clinical Assistant Professor Medical Education at University of Cincinnati
Radiation Oncologist OHC, Inc
Overview

• Epigenetics & Telomeres
• Anti-Inflammatory Diet
• Antioxidants
• Diet Guidelines & Resources
Questions to Discuss

• Does what you eat really contribute to the development of cancer?

• What does research say about the impact of different types of foods on cancer and its treatment?
What is Integrative Medicine?

*Integrative Medicine* is the practice of medicine that reaffirms the importance of the relationship between practitioner and patient, focuses on the whole person, is informed by evidence, and makes use of all appropriate therapeutic approaches, healthcare professionals, and disciplines to achieve optimal health and healing.

Epigenetics

- Literally “above” or “on top of” genetics
- Refers to external modifications to DNA that turn genes either “on” or “off”
- Do not change the DNA sequence, but instead, affect how cells “read” genes
Epigenetics in Action: The Agouti Mouse

Yellow agouti mice become obese and have a high risk of diabetes, cancer, and shortened lifespan.

Brown agouti mice are thin, with a normal lifespan and reduced risk of diabetes and cancer.

Regular mouse food mouse food fortified with nutrients

Epigenetics in Action

These Two Mice are Genetically Identical and the Same Age

While pregnant, both of their mothers were fed Bisphenol A (BPA) but DIFFERENT DIETS:

- The mother of this mouse received a normal mouse diet
- The mother of this mouse received a diet supplemented with choline, folic acid, betaine and vitamin B12
How Do We Alter Gene Expression?

- Diet
- Exercise
- Stress Reduction
Histone modifications

- Tomatoes (lycopene)
- Turmeric (curcumin)
- Cinnamon (coumaric acid)
- Cashew nuts (anacardic acid)
- Apples (phloretin)
- Soybean (genistein)
- Tea (EGCG)
- Grapes (resveratrol)
- Citrus (hesperidin)
- Coffee (caffeic acid)
- Broccoli (isothiocyanates)
- Garlic (allyl mercaptan)

DNA methylation
Anti-Inflammatory Diet
Anti-Inflammatory Pyramid

HEALTHY SWEETS (such as plain dark chocolate) Sparingly

RED WINE (optional) No more than 1-2 glasses a day

SUPPLEMENTS Daily

TEA (white, green, oolong) 2-4 cups a day

HEALTHY HERBS & SPICES (such as garlic, ginger, turmeric, cinnamon) Unlimited amounts

OTHER SOURCES OF PROTEIN (high quality natural cheeses and yogurt, omega-3 enriched eggs, skinless poultry, lean meats) 1-2 a week

COOKED ASIAN MUSHROOMS Unlimited amounts

WHOLE SOY FOODS (edamame, soy nuts, soymilk, tofu, tempeh) 1-2 a day

FISH & SEAFOOD (wild Alaskan salmon, Alaskan black cod, sardines) 2-6 a week

HEALTHY FATS (extra virgin olive oil, expeller-pressed canola oil, nuts - especially walnuts, avocados, seeds - including hemp seeds and freshly ground flaxseeds) 5-7 a day

WHOLE & CRACKED GRAINS 3-5 a day

PASTA (al dente) 2-3 a week

BEANS & LEGUMES 1-2 a day

VEGETABLES (both raw and cooked, from all parts of the color spectrum, organic when possible) 4-5 a day minimum

FRUITS (fresh in season or frozen, organic when possible) 3-4 a day
## Food Sources of Chemopreventive Substances

<table>
<thead>

Telomeres
A small UCSF pilot study shows for the first time that changes in diet, exercise, stress management and social support can result in longer telomeres, the parts of chromosomes that affect aging.

Here are some lifestyle changes undertaken by study participants:

<table>
<thead>
<tr>
<th>Number</th>
<th>Lifestyle Change</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><strong>DIET</strong></td>
</tr>
<tr>
<td></td>

Exercise and Lung Cancer Prognosis

• Prospective observational analysis (n = 296) of preoperative patients evaluated if performance on stair-climbing test was a prognostic factor in non-small cell lung cancer (NSCLC)
  • Patients who climbed more than 18 meters on the stair climb had significantly longer median (months) survival and 5-year survival than those who climbed less than 18 meters (97 vs 74; 77% vs 54%, p=0.001)

• Interventions aimed at improving exercise tolerance can be useful to improve long-term prognosis after NSCLC operations

Brunelli, 2012
Ketogenic Diet Benefits During Treatment

- One of the fundamental differences between cancer cells and normal cells is in how they break down (metabolize) nutrients to obtain the energy they need to grow and survive.
- A ketogenic diet limits glucose metabolism and emphasizes oxidative metabolism of fatty acids, ketone bodies, and amino acids in mitochondria.
- Mitochondria from tumor cells produce more superoxide and hydrogen peroxide than mitochondria from normal cells.
- Consuming a ketogenic diet should therefore selectively enhance the sensitivity of tumor cells to treatments that increase oxidative stress, such as radiation and chemotherapy.

http://www.cancer.gov/clinicaltrials/featured/trials/ketolung
Ketogenic Diet Benefits During Treatment: Current Clinical Study

- Patients with stage III or IV (with limited metastasis) non-small cell lung cancer will follow a ketogenic diet 48 hours before chemoradiation therapy and continue through the end of the 6- to 7-week treatment period
  - Consume formulated shakes in the morning and work with dietician to maintain similar calorie balance throughout the day

- Assessing:
  - Safety and tolerability of the diet in conjunction with chemoradiation treatment
  - Levels of glucose and ketones in the blood and oxidative stress markers in plasma and urine

- About 90 percent of calories in the ketogenic diet used in the study come from fat, whereas less than 2 percent of calories come from carbohydrates, with protein supplying the remaining calories

- Hypothesis:
  - Ketogenic diet will deprive the tumor of glucose which it depends on for energy as well as enhance oxidative stress

http://www.cancer.gov/clinicaltrials/featured/trials/ketolung
Foods That *Decrease* Risk of Lung Cancer

- **Vegetables/ Leafy Greens**
  - A large European study found that consumption of a variety of vegetables is inversely associated with lung cancer risk among current smokers
  - Specifically, leafy greens help reduce risk

- **Walnuts**
  - The antimitogenic effects of walnut extract were associated with a twofold reduction of mitochondria respiration. These results suggest impairment of mitochondrial function and apoptosis as a relevant mechanism of anticancer effects

Red Meat as a Trigger

- Milan Cancer Institute Study
  - Patients who consumed red meat 2-3 times weekly had *higher rates of recurrence* than those consuming a Mediterranean diet

- Additional study—lung cancer screening program of over 4000 patients, 178 of whom were diagnosed with lung cancer
  - Found that among heavy smokers, high red meat consumption and low adherence to a Mediterranean diet are associated with *increased risk* of lung cancer

Other Foods That *Increase* Risk

- **Sugar & Saturated Fats**
  - Case-control studies of subjects with lung cancer found that high sugar and saturated fat intake increased the risk of lung cancer

- **Acrylamide (French fries, potato chips)**
  - A large case-cohort study conducted for 13.3 years in The Netherlands found an association between acrylamide intake and lung cancer in women, but no association found in men

De Stefani E, 1997; De Stegani E, 1998; Hogervorst JG, 2009
Diet and Exercise Guidelines for Lung Cancer & Resources
American Cancer Society Guidelines—2006

• Exercise:
  • Maintain a healthy weight throughout life
  • Balance caloric intake with physical activity
    - **Adults**: at least 30 minutes of moderate to vigorous activity on 5 or more days/week; 45-60 minutes better
    - **Children and adolescents**: at least 60 minutes of moderate to vigorous activity at least 5 days/week

• Diet:
  • Consume a healthy diet, with an emphasis on plant sources
  • Eat 5 or more servings of a variety of fruits and vegetables each day; every meal and snacks
  • Limit consumption of processed and red meats
  • Drink no more than one alcoholic drink per day for women or two per day for men

Kushi CA Sept/Oct 2006
Diet Based on Current Research

**Encourage**
- Mediterranean Diet
- Anti-Inflammatory Diet
- Regular consumption of green leafy vegetables and Brassica vegetables
- Regular consumption of nuts (e.g. walnuts), seeds, fruits, and spices

**Avoid**
- Foods rich in simple carbohydrates and saturated fats
- Foods rich in acrylamide, including heated starches such as fried or baked potato products (French fries, potato chips) and coffee
Antioxidants
My Antioxidant Approach

- Individual advice depends on goal of Rx
  - If cure, err on side of caution
    - Delay antioxidants until end of Rx
    - Discontinue day before, of, after chemo cycle
    - Antioxidant rich foods probably ok
  - If palliation, encourage use for protection of normal tissue, optimization of QOL
- Antioxidant radio- and chemoprotectants (mesna, amifostine) do not interfere with anti-tumor effects of Rx
