

Summary:

China's "Handbook of COVID-19 Prevention and Treatment"

The First Affiliated Hospital, Zhejiang University School of Medicine Compiled According to Clinical Experience Prof. Tingbo LIANG, Editor-in-Chief (this is a much abbreviated summary done by D.W. NUSS MD)

Contents

Part One **Prevention and Control Management**

I.	I. Isolation Area Management.....	1
II.	II. Staff Management.....	4
III.	III. COVID-19 Related Personal Protection Management.....	5
IV.	IV. Hospital Practice Protocols during COVID-19 Epidemic.....	6
V.	V. Digital Support for Epidemic Prevention and Control.....	16

Part Two **Diagnosis and Treatment**

I.	I. Personalized, Collaborative and Multidisciplinary Management.....	18
II.	II. Etiology and Inflammation Indicators.....	19
III.	III. Imaging Findings of COVID-19 Patients.....	21
IV.	IV. Application of Bronchoscopy in the Diagnosis and Management of COVID-19 Patients.....	22
V.	V. Diagnosis and Clinical Classification of COVID-19.....	22
VI.	VI. Antiviral Treatment for Timely Elimination of Pathogens.....	23
VII.	VII. Anti-shock and Anti-hypoxemia Treatment.....	24
VIII.	VIII. The Rational Use of Antibiotics to Prevent Secondary Infection.....	29
IX.	IX. The Balance of Intestinal Microecology and Nutritional Support.....	30
X.	X. ECMO Support for COVID-19 Patients.....	32
XI.	XI. Convalescent Plasma Therapy for COVID-19 Patients.....	35
XII.	XII. TCM Classification Therapy to Improve Curative Efficacy.....	36
XIII.	XIII. Drug Use Management of COVID-19 Patients.....	37
XIV.	XIV. Psychological Intervention for COVID-19 Patients.....	41
XV.	XV. Rehabilitation Therapy for COVID-19 Patients.....	42
XVI.	XVI. Lung Transplantation in Patients with COVID-19.....	44
XVII.	XVII. Discharge Standards and Follow-up Plan for COVID-19 Patients.....	45

Part Three **Nursing**

I.	I. Nursing Care for Patients Receiving High-Flow Nasal Cannula (HFNC) Oxygen Therapy.....	47
II.	II. Nursing Care in Patients with Mechanical Ventilation.....	47
III.	III. Daily Management and Monitoring of ECMO (Extra Corporeal Membrane Oxygenation)	49
IV.	IV. Nursing Care of ALSS (Artificial Liver Support System).....	50
V.	V. Continuous Renal Replacement Treatment (CRRT) Care.....	51
VI.	VI. General Care.....	52

Appendix

I.	I. Medical Advice Example for COVID-19 Patients.....	53
II.	II. Online Consultation Process for Diagnosis and Treatment.....	57

References.....	59
-----------------	----

Part One Prevention and Control Management

I Isolation Area Management

Fever Clinic

- layout at entrance; one-way only
- Zone arrangement: independent examination room, a laboratory, an observation room, and a resuscitation room;
- Patient Management:
 - Pts with fevers must wear masks
 - Limit proximity and visitors to minimize exposures
 - Prompt dispositions to minimize exposures
 - Educate pts & families
- Screening, Admission and Exclusion

Isolation Ward Area

- Observation section, isolation section, and isolation-ICU section
- Suspected vs. Confirmed patients are in separate areas
 - Suspected cases in private rooms, private bathrooms
 - Confirmed cases may be in wards, separated at least 4 feet apart
- Patient Management:
 - Visitors not allowed; patients are permitted to keep their phones
 - Educate patients on how to not spread COVID; instruct them on facemasks, hand washing, cough etiquette, home observation, etc.

II Staff Management

Workflow Management

- First must train staff in PPE
- Divide teams; 4 hours maximum in isolation areas
- Before going off-shift, staff must wash themselves and conduct necessary personal hygiene regimens to prevent possible infection of their respiratory tracts and mucosa.

Health management

- Front line staff shall live in isolation accommodations
- Shall be provided nutritious diet
- Shall monitor and record health status
 - Fever, respiratory symptoms, mental health
 - Isolate if fever/symptoms arise
- Testing recommended when they return to community; if COVID negative must continue isolation 14 days, to protect them

III COVID-19 Related Personal Protection Management (see page 10)

- PPE levels 1, 2, & 3 depending on duties
 - Level 1 (disposable cap, mask, gloves, gown) for pre-exam triage & gen. outpatient dept.
 - Level 2 (disposable cap, N95 mask, goggles, gloves, gown) for noninvasive, non-respiratory contact areas

- Level 3 (disposable cap, N95 mask, goggles, gloves, gown, full-face respiratory protective devices or powered air-purifying respirator [PAPR]) for airway procedures, surgery, or autopsy

○

IV Hospital Practice Protocols During COVID-19 Epidemic

- Guidance on donning & doffing procedures for all
- Donning: Protocol for Donning PPE:
 - Put on special work clothes and work shoes →
 - Wash hands →
 - Put on disposable surgical cap →
 - Put on medical protective mask (N95) →
 - Put on inner disposable nitrile/latex gloves →
 - Put on goggles and protective clothing (note: if wearing protective clothing without foot covers, please also put on separate waterproof boot covers), put on a disposable isolation gown (if required in the specific work zone) and face shield/powered air-purifying respirator(if required in the specific work zone) →
 - Put on outer disposable latex gloves
- Doffing: Protocol for Removing PPE:
 - Wash hands and remove visible bodily fluids/blood contaminants on the outer surfaces of both hands →
 - Wash hands replace outer gloves with new gloves →
 - Remove powered air-purifying respirator or self-priming filter-type full-face mask/mask (if used) →
 - Wash hands →
 - Remove disposable gowns along with outer gloves (if used) →
 - Wash hands and put on outer gloves →
 - Enter Removal Area No. 1 →
 - Wash hands and remove protective clothing along with outer gloves (for gloves and protective clothing, turn inside out, while rolling them down) (note: if used, remove the waterproof boot covers with clothing) →
 - Wash hands →

- Enter Removal Area No. 2 →
- Wash hands and remove goggles →
- Wash hands and remove mask →
- Wash hands and remove cap →
- Wash hands and remove inner disposable latex gloves →
- Wash hands and leave Removal Area No. 2 →
- Wash hands, take a shower, put on clean clothes and enter the clean area

Disinfection Procedures for COVID-19 Isolation Ward Area	(see manual)
Disinfection Procedures for Spills of COVID Blood/Fluids	(see manual)
Disinfection Procedures for COVID Reusable Medical Devices	(see manual)
Disinfection Procedures for Fabrics of Suspected or Confirmed Patients	(see manual)
Disposal Procedures for COVID-Related Medical Waste	(see manual)
Procedures for taking Remedial Actions against Occupational Exposure	(see manual)

Surgical Operations for Suspected or Confirmed COVID-19 Patients:

- **OR & PPE:**
 - Negative pressure ventilation rooms; temp/humidity controlled
 - All surgical personnel (including surgeons, anesthesiologists, hand-washing nurses, and charge nurses in operating room) should put on their PPE in the buffer room before entering the operating room:
 - Put on double caps, medical protective mask (N95), medical goggles, medical protective clothing, boot covers, latex gloves, and powered air-purifying respirator;
 - surgeons and the hand-washing nurses should wear disposable sterile operating clothes and sterile gloves in addition to the PPE as mentioned above;
 - Patients should wear disposable caps + disposable surgical masks according to their situation;
 - The charge nurses in the buffer room are responsible for delivering items from the buffer area to the negative pressure operating room;
 - During the operation, the buffer room and the operating room shall be tightly closed, and the operation must be carried out only if the operation room is under negative pressure;
 - Irrelevant personnel shall be excluded from entering the operating room.

Procedures for Final Disinfection

- Medical waste shall be disposed of as COVID-19 related medical waste;
- Reusable medical devices shall be disinfected according to the disinfection procedures of SARS-CoV-2 related reusable medical devices;
- Medical fabrics shall be disinfected and disposed of according to the disinfection procedures for SARS-CoV-2 related infectious fabrics;
- Surfaces of objects (instruments and devices including device table, operating table, operating bed, etc.);
 - Visible blood/bodily fluid pollutants shall be completely removed before disinfection (handled in accordance with disposal procedures of blood and bodily fluid spills).
 - All surfaces shall be wiped with a disinfectant containing 1000 mg/L active chlorine and allowed to sit for 30 minutes with the disinfectant.

- Floors and walls:
 - Visible blood/bodily fluid pollutants shall be completely removed before disinfection (handled in accordance with disposal procedures of blood and bodily fluid spills).
 - All surfaces shall be wiped with a disinfectant containing 1000 mg/L active chlorine and allowed to sit for 30 minutes with the disinfectant.
- Indoor air: Turn off the fan filter unit (FFU). Disinfect the air by irradiation by ultraviolet lamp for at least 1 hour. Turn on the FFU to purify the air automatically for at least 2 hours.

Procedures for Handling Bodies of Deceased Suspected or Confirmed Patients (see manual)

Digital Support for Epidemic Prevention and Control (see manual)

+++++

Part Two: Diagnosis and Treatment

- I. Personalized, Collaborative and Multidisciplinary Management (see manual)
- II. Etiology and Inflammation Indicators
 - a. Detection:
 - i. Specimen collection
 - ii. Nucleic acid detection
 - iii. Virus isolation & culture
 - iv. Detection of serum antibody
 - v. Detecting indicators of inflammatory response
 - vi. Detection of secondary bacterial or fungal infection
 - vii. Laboratory safety
- III. Imaging Findings of COVID-19 Patients
 - a. Hi-res CT preferred
 - b. Portable CXR for immobile/critical patients
 - c. Typical CT features of COVID-19 :
 - i. patchy ground glass opacities;
 - ii. nodules and patchy exudation;
 - iii. multifocal consolidation lesions;
 - iv. diffuse consolidation, "white lung"
- IV. Bronchoscopy in COVID management
 - a. Collection of specimens
 - b. Suction of secretions; blood
 - c. Control of bleeding
 - d. Delivery of therapeutic drugs to bronchi
 - e. Aid in the placement of ET tubes or percutaneous tracheostomy
- V. Diagnosis & Clinical Classification of COVID infection
 - a. Early diagnosis, treatment and isolation should be carried out whenever possible.
 - b. Dynamic monitoring of lung imaging, oxygenation index and cytokine levels are helpful for early identification of patients who may develop into severe and critical cases.

- c. A positive result of the nucleic acid of SARS-CoV-2 is the gold standard for the diagnosis of COVID-19.
- d. However, considering the possibility of false negatives in nucleic acid detection, suspected cases characteristic manifestations in CT scans can be treated as confirmed cases even if the nucleic acid test is negative.
- e. Isolation and continuous tests of multiple specimens should be carried out in such cases.
- f. The diagnostic criteria follow Protocols for the Diagnosis and Treatment of COVID-2019. A confirmed case is based on epidemiological history (including cluster transmission), clinical manifestations (fever and respiratory symptoms), lung imaging, and results of SARS-CoV-2 nucleic acid detection and serum-specific antibodies.
 - i. **Clinical Classifications:**
 1. **Mild Cases** The clinical symptoms are mild and no pneumonia manifestations can be found in imaging.
 2. **Moderate Cases** Patients have symptoms such as fever and respiratory tract symptoms, etc. and pneumonia manifestations can be seen in imaging.
 3. **Severe Cases** Adults who meet any of the following criteria: respiratory rate ≥ 30 breaths/min; oxygen saturation $\leq 93\%$ at a rest state; "**Oxygen Index**", or $(PaO_2) / (FiO_2) \leq 300$ mmHg. Patients with $> 50\%$ lesions progression within 24 to 48 hours in lung imaging should be treated as severe cases.
 4. **Critical Cases** Meeting any of the following criteria: occurrence of respiratory failure requiring mechanical ventilation; presence of shock; other organ failure that requires monitoring and treatment in the ICU.
 5. **Critical cases are further divided into early, middle and late** stages according to the oxygenation index and compliance of respiratory system.
 - a. Early stage: $100 \text{ mmHg} < \text{oxygenation index} \leq 150 \text{ mmHg}$; compliance of respiratory system $\geq 30 \text{ mL / cmH}_2\text{O}$; without organ failure other than the lungs. The patient has a great chance of recovery through active antiviral, anti-cytokine storm, and supportive treatment.
 - b. Middle stage: $60 \text{ mmHg} < \text{oxygenation index} \leq 100 \text{ mmHg}$; $30 \text{ mL/cmH}_2\text{O} > \text{compliance of respiratory system} \geq 15 \text{ mL/cmH}_2\text{O}$; may be complicated by other mild or moderate dysfunction of other organs.
 - c. Late stage: oxygenation index $\leq 60 \text{ mmHg}$; compliance of respiratory system $< 15 \text{ mL/cmH}_2\text{O}$; diffuse consolidation of both lungs that requires the use of ECMO; or failure of other vital organs. The mortality risk is significantly increased.

Treatment:

- VI. Antiviral Treatment for Timely Elimination of Pathogens.....23
 - a.
 - i. Lopinavir/Ritonavir (2 weeks)

- ii. Chloroquine (7 days only)
 - iii. Interferon (in negative pressure environments only)
 - iv. Steroids for specific indications only
 - v. Artificial Liver Treatment for suppression of Cytokine Cascade
- VII. Anti-shock and Anti-hypoxemia Treatment.....24
 - i. Oxygen saturation monitoring at all times
 - 1. Deterioration may be quite rapid
 - 2. O₂ for hypoxemia/dyspnea
 - 3. Ratio of PaO₂/FiO₂ is a sensitive and accurate indicator of oxygenation
 - ii. Options:
 - 1. High flow nasal cannula – HFNC, up to 40-60L/min
 - 2. Tracheal intubation
 - a. dependent on disease progression, systemic status and complication of patients for those with stable situation but with a low oxygenation index (<100 mmHg).
 - 3. Mechanical Ventilation:
 - a. Noninvasive Ventilation (NIV): not recommended in most
 - i. Can cause gastric distension, & worsen lung injury
 - ii. Can result in more viral contamination
 - b. Endotracheal Intubation
- VIII. Rational use of antibiotics to prevent secondary infection;page 29
 - a. With discretion and proper indications
 - b. Not primary therapy; only for specific indications
- IX. The Balance of Intestinal Microecology and Nutritional Support.....30
 - a. Some COVID patients have abdominal pain and diarrhea
 - b. The normal gut biome is altered; distension & gastroparesis are not unusual
 - c. “Microecologics” may be administered
 - d. Nutrition:
 - i. Oral feeds preferred
 - ii. For intubated patients, indwelling intestinal feeding tube is recommended for post-pyloric feeding.
 - iii. Caution about patients with aspiration risk; parenteral feeds may be needed
- X. ECMO Support for COVID-19 Patients.....32
 - a. The virus targets pulmonary alveoli
 - b. Extracorporeal membrane oxygenation (ECMO) can help in COVID-19 treatment
 - c. Medical professionals need to pay close attention to the following: the time and means of intervention, anticoagulant and bleeding, coordination with mechanical ventilation, awake ECMO and the early rehabilitation training, strategy of handling for complications.
 - d. Indications:
 - i. Failure of 72 hours of ventilator support, with Oxygenation Index <80mmHg
 - ii. “pPlat”, or plateau pressure, <30mmHg and PaCO₂>55
 - iii. pneumothorax, pneumomediastinum
 - iv. circulatory deterioration requiring pressors
 - v. after CPR
 - vi. severely decreased lung compliance

- vii. very detailed section on other ECMO and supportive considerations; see manual

viii.

- XI. Convalescent Plasma Therapy for COVID-19 Patients.....35
 - a. WHO: “convalescent plasma therapy is one of the recommended potential therapies, and it has been used during other epidemic outbreaks”
 - b. Indication(1) Severe or critically ill COVID -19 patients tested positive
 - c. COVID Positive patients who are immunosuppressed

- XII. TCM (*Traditional Chinese Medicine*) Classification Therapy to Improve Curative Efficacy.....36
 - a. Classification and Stage COVID-19 can be divided into early, middle, critical and recovery stages.
 - b. At the **early stage**, the disease has two main types: “wet lungs” and “external cold and internal heat.”
 - c. The **middle stage** is characterized by “intermittent cold and heat.”
 - d. The **critical stage** is characterized by “internal block of epidemic toxin.”
 - e. The **recovery stage** is characterized by “qi deficiency in lung-spleen.”
 - f. The disease initially belongs to wet lung syndrome. Due to fever, both intermittent cold and heat treatments are recommended.
 - g. In the middle stage, cold, dampness, and heat coexist, belonging to “cold-heat mixture” in terms of TCM. Both cold and heat therapy should be considered
 - h. According to the theory of TCM, heat should be treated with cold drugs. But cold drugs impair Yang and lead to a cold spleen and stomach and cold-heat mixture in the middle-Jiao. Therefore, in this stage both cold and heat therapies should be considered. Because cold-heat symptoms are commonly seen in COVID-19 patients, the cold-heat therapy is better than other approaches.

- XIII. Drug Use Management of COVID-19 Patients.....37
 - a. Adverse drug-drug interactions very common in COVID patients
 - b. *Specific effects and dosages listed in manual*

XIV.	Psychological Intervention for COVID-19 Patients.....	41
	a. High percentage of anxiety, depression	
	b. Delirium among seriously ill	
	c. Post-discharge depression	
XV.	Rehabilitation Therapy for COVID-19 Patients.....	42
	a. Many patients need rehab for different reasons	
	b. Respiratory rehab: postural, incentive breathing; deep breath exercises, etc.	
	c. PEEP training	
XVI.	Lung Transplantation in Patients with COVID-19.....	44
	a. For survivors whose lung function is inadequate	
	b. Must be proven COVID negative after recovery	
	c. Must have sufficient cardiac, renal, hepatic function	
•	Discharge Standards and Follow-up Plan for COVID-19 Patients.....	45
	○ Discharge standards	
	▪ Body temperature remains normal for at least 3 days (ear temperature is lower than 37.5 °C);	
	▪ Respiratory symptoms are significantly improved;	
	▪ The nucleic acid is tested negative for respiratory tract pathogen twice consecutively (sampling interval more than 24 hours); the nucleic acid test of stool samples can be performed at the same time if possible;	
	▪ Lung imaging shows obvious improvement in lesions	
	▪ There is no comorbidities or complications which require hospitalization;	
	▪ SpO2 > 93% without assisted oxygen inhalation	
	▪ Discharge approved by multi-disciplinary medical team.	
	○ Home isolation	
	▪ Patients must continue two weeks of isolation after discharge . Recommended home isolation conditions are:	
	▪ Independent living area with frequent ventilation and disinfection;	
	▪ Avoid contacting with infants, the elderly and people with weak immune functions at home	
	▪ Patients and their family members must wear masks and wash hands frequently;	

- Body temperature are taken twice a day (in the morning and evening) and pay close attention to any changes in the patient's condition.
- Follow-up
 - A specialized doctor should be arranged for each discharged patient's follow-ups. The first follow-up call should be made within 48 hours after discharge. The outpatient follow-up will be carried out 1 week, 2 weeks, and 1 month after discharge.
 - Examinations include liver and kidney functions, blood test, nucleic acid test of sputum and stool samples, and pulmonary function test or lung CT scan should be reviewed according to the patient's condition.
 - Follow-up phone calls should be made 3 and 6 months after discharge.
- Management of patients tested positive again after discharge
 - Strict discharge standards have been implemented in our hospital.
 - There is no discharged case in our hospital whose sputum and stool samples are tested positive again in our follow-ups.
 - However, there are some reported cases that patients are tested positive again, after being discharged based on the standards of national guidelines (negative results from at least 2 consecutive throat swabs collected at an interval of 24 hours; body temperature remaining normal for 3 days, symptoms significantly improved; obvious absorption of inflammation on lung images).
 - It is mainly due to sample collection errors and false negative testing results. For these patients, the following strategies are recommended:
 - (1) Isolation according to the standards for COVID-19 patients.
 - (2) Continuing to provide antiviral treatment which has been proved to be effective during prior hospitalization.
 - (3) Discharge only when improvement is observed on lung imaging and the sputum and stool are tested negative for 3 consecutive times (with an interval of 24 hours).
 - (4) Home isolation and follow-up visits after discharge in accordance with the requirements mentioned above.
